

Why Distribution Safety Management ?

The theme safety in operations and logistic processes is usually already understood by those who act in the several supply chains, either by the compulsory attendance of the legislation and involved regulatory rules, by the obtaining of certifications, by the inspections developed by companies taking and/or providing logistic services, and also by systems and programs developed by class associations applied to the respective markets and products.

The use of these important tools, if we can call them that, covers the processes under its scope, however, in more than two decades living the daily life of the logistic chain of several market segments, by the industry, by logistic operators, carriers and also class associations, hiring services, performing assessments, homologating, auditing, implementing and training, despite all the tools and investments, it is observed the lack of a robust system of management in distribution safety.

It is not rare to experience the situation: *What happened to the company such (or operation...), until last year it had an excellent performance, but in that year hard drop in performance, increase in deviations and accidents...?*

Even with all standards, certifications and evaluation systems in place, the results are not effective.

It is significant the probability of the cause being in the fragility or even absence of a management system that consider all these tools, but which add content without double standards and rework, though Distribution Safety Management elements.

Why Distribution Safety Management?

Save Lives

Reduce Exposure to Risks

Reduce Deviations and Incidents

Reduce, Eliminate Losses

Reduce Costs

Increase Productivity

Get Safe Behavior Culture

Company Image

Perpetuate the Business
